Science Word of the Week

FOOD WEB

This is what you get when you combine all of an ecosystem's food chains

A food web is a map of what organisms eat what other organisms in a given area. Those life forms include all the species in that area, such as plants, animals and even microbes. Food webs represent feeding relationships with arrows. Each arrow points from the species getting eaten (the prey) to the species feeding on them (the predator).

Science @ St. Teresa's

This week, air cleaners have been in the news- click the pic below.

This reminded me of some amazing work our own children, Tanino, Amelia, Madeleine and Adam did last year.

Over a period of time, they collect data from the air cleaners we have in school and presented their findings at a big Institute of Engineering event in Westminster. Click the video and from around 15 minutes you'll see a presentation and also a Q&A with our amazing children.

Do you have a science news story you want to share?

How about a lovely piece of science work you're proud of?

Perhaps an extraordinary experiment or piece of research you've done at home?

What about a wonderful science word for our Word of the Week?

Let your teacher know or come and see Mr. Humphrey
